November 2014

Gasoline

To the Editors,

To the Editors, with particular regard to the September 12, 2014 issue of Science, which included the paper "In vivo T cell responses to influenza virus in humans," we wish to bring to your attention some points of clarification that we believe are necessary.

Firstly, it is important to note that the study of the in vivo T cell responses to influenza virus in humans was conducted with the aim of elucidating the immune responses to influenza virus in vivo. The study involved the administration of influenza virus to healthy volunteers who were monitored closely for T cell responses.

Secondly, the study utilized a novel approach to analyze T cell responses in vivo. The researchers employed high-throughput sequencing to characterize the T cell repertoire in response to influenza virus infection.

Finally, the results of the study have significant implications for the development of influenza vaccines. The findings not only provide insights into the immune responses to influenza virus in vivo, but also highlight the potential of using high-throughput sequencing to monitor and track the T cell responses to influenza virus in real-time.

We believe that these points of clarification are essential for a full understanding of the study and its implications. We appreciate your consideration.

Sincerely,
